### Search Notes

Examiner Ford,

Here are the results of the search you requested.

Please feel free to contact me if you have any questions.

In re:09596101 Sequence search

Please search SEQ ID NO:1 and 3.

Please include interference searches. Please rush.

Vanessa L. Ford

Other (specify):	

Pending Nucleic Acid and Pending Amino Acid database searches generate two sets of results each. The Pending databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions .rnpm and .rnpn

Searches run against the Amino Acid Pending database produce two sets of results, with the extensions .rapm and .rapn

Because they contain data that is confidential, the results of Pending database searches should not be left in the case .

>	I am an examiner in Workgroup: Example: 1610
· >	Relevant prior art found, search results used as follows:
	☐ 102 rejection
	☐ 103 rejection
	Cited as being of interest.
	Helped examiner better understand the invention.
	Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
,	☐ Foreign Patent(s)
	Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
>	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine patentability).
	Results were not useful in determining patentability or understanding the invention.
Cor	mments:

Proposition General Completed to insite Still (State of Chem) (State) (Milardine Insite of Chem)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                  Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibacterial and antiinflammatory activity. Recombinant coelomic cytolytic factor 1 (rCCF-1) is trypanolytic for the African trypanosome Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity of rCCF-1 can be inhibited by anti-CCF-1 and anti-tumour necrosis factor (TNF)/TIP monoclonal antibodies. Furthermore, N,N'-diacetlychitobiose inhibits potently trypanolytic activity of rCCF-1. These data corroborate the findings that CCF-1 shares a trypanolytic, lectin-like domain with TNF-alpha. CCF-1 is useful to treat trypanosomal or bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. The annelid peptide is derived from a 42 kDa cytolytic protein named CCF-1 that binds lipopolysaccharide and beta-1,3-glucan. The factor resembles the vertebrate tumour necrosis factor-alpha (TNF-alpha), and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (rCCF-1) is trypanolytic for the African trypanosome Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity of rCCF-1 can be inhibited by anti-CCF-1 and anti-tumour necrosis factor (TNF)/TIP monoclonal antibodies. Furthermore, N,N'-diacetlychitobiose inhibits potently trypanolytic activity of rCCF-1. These data corroborate the findings that CCF-1 shares a trypanolytic, lectin-like domain with TNF-alpha. CCF-1 is useful to treat trypanosomal or bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. The annelid peptide is derived from a 42 kba cytolytic protein named CCF-1 that binds lipopolysaccharide and beta-1,3-glucan. The factor resembles the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LLG109 is useful for degrading or modifying beta-glucan-contg. material. Its amino acid sequence was deduced from a genomic DNA sequence (AAT29043) isolated from an O. xanthineolytica library. Recombinant beta-1,3-glucanase can be produced on a large scale using transformed host cells, esp. Bacillus subtilis DN1885 or Toc46. Protease-free beta-1,3-glucanase can be obtd. that is useful for lysing fungal cell walls, allowing recovery of intracellular proteins. The enzyme is also useful for the prepn. of protoplasts and for the prodn. of pigments, colorants, flavours, yeast extract
                                                                                               Sequence

                                                                                This polypeptide comprises a novel Oerskovia xanthineolytica (OX)
enzyme that exhibits beta-1.3-glucanase (BG) activity. Its amino
acid sequence was deduced from an isolated genomic DNA sequence
(see AAR89155). Claimed DNA constructs that encode the novel BG (see
AAW29456 for corrected sequence), a mannose binding domain (see
AAW29456) or a full-length enzyme, i.e. BG with mannose binding
domain (see AAW29456), can be used to produce recombinant BG
polypeptides, with or without a mannose binding domain, in fungal
or bacterial host cells. BG polypeptides are used for the
degradation or modification of beta-glucan containing material,
especially for the gentle lysis of microbial cell walls, thereby
reduced amount of contaminants. They can also be used for the
production of e.g. pigments, colourants, flavourants, yeast
extracts, pharmaceuticals, food or feed compositions, and to
prepare protoplasts for use in fusion, transformation and cloning

                                                                                                                                                    cerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89157). Claimed DNA constructs that encode the novel BG (see also AAW29455), a mannose binding domain (see AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29458), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal cor bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, cespecially for the gentle lysis of microbial cell walls, thereby cenabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast centracts, pharmaceuticals, food or feed compositions, and to

                                                                                                                                                                                                               (BG) activity and which includes a mannose binding domain (MBD). Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89156). Claimed DNA constructs that encode the novel BG lacking a MBD (see AAW29455 and AAW2947), a MDB (see AAW29458), or the full-length enzyme can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oerskovia xanthineolytica beta-1,3-glucanase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acnes in a particularly involved in the inflammatory cannot be presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by conzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qy
polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating of disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of diagnostics, for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human contact of the invention.

Note: The sequence data for this patent did not appear in the printed sepecification, but was obtained in electronic format directly from WIPO as for the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to isolated polynucleotide (I) and CC polymerase chain reaction (FCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (CC for identifying expressed genes. (I) is useful in gene therapy techniques (CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in treating cC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this pattent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fire the sequence data for this pattent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fire the sequence data for this pattent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at fire the sequence of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC Streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS
CC (Streptococcus/GBS), comprising one of 5483 sequences ($1), given in CC the specification. The proteins have antibacterial and antiinflammatory CC activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and CC antibodies that bind (I) are used in the manufacture of medicaments for CC treptococcus bacteria, particularly S. agalactiae and S. pyrogenes. CC Nucleic acids encoding (I) are used to detect Streptococcus in a CC biological sample. (I) is used to detect Streptococcus in a CC (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by CC Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity CC Streptococcus proteins and distinguishing/identifying CC Streptococcus proteins and selections and distinguishing/identifying CC Streptococcus proteins and selection an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The invention relates to a protein (ABP25413-ABP30895) from group B CC streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in CC the specification. The proteins have antibacterial and antiinflammatory CC activity. (I), nucleic acids encoding (I), ABMS6044-ABM71526 and CC antibodies that bind (I) are used in the manufacture of medicaments for CC the treatment or prevention of infection or disease caused by CC Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. CC Nucleic acids encoding (I) are used to detect Streptococcus in a CC biological sample. (I) is used to detectmine whether a compound binds to CC (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be CC streptococcus that is prevented or treated may be meningitis. Nucleic CC acid encoding (I) may be used to recombinantly produce (I) and may be CC used in gene therapy. Antibodies to I) are used for affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                     CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polyperase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical conditions of the separating of sites expressing (II). (I) and (II) are useful for treating CC disgraphing of sites expressing (II). (I) and (II) are useful for treating CC disgnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess blodiversity amino acid sequences of the invention.

CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30373 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed cast first who, with the souther content of creat directly from WIPO at frequency.
                                                                                                                                                                                                                                                                                                                  Sequence

-!- FUNCTION: DNA-DEPENDENT RNA POLYMERASE CATALYZES THE TRANSCRIPTION OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS SUBSTRATES (By Similarity).

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STRAIN-El Tor N16961 / Serotype 01;
